

Medically Supervised Weight Loss

When your body carries excess weight, its natural harmony of metabolic pathways is disrupted, and there is an increased potential for symptoms and disease expression.

What this means is that your body is out of balance, and you need a weight loss solution which not only helps you lose weight, but that also restores the body's natural ability to keep weight off.

The weight loss program at Complete Healthcare Medical Center utilizes hCG, Human Chorionic Gonadotropin. hCG is a hormone which is naturally produced in the body. It rapidly targets and metabolizes areas of excess fat storage without hunger. hCG studies have shown that the weight lost comes directly from adipose fat tissue rather than lean muscle. It does not strip the body of vitamins or minerals which are essential to maintain good health. The action of hCG on the hypothalamus gland is what will enable the weight loss to be lasting. The hypothalamus will be reset, adjusting your metabolism so that you can be satisfied without over-eating. In addition to weight loss and body reshaping, hCG will regulate blood sugar levels, lower blood pressure and decrease many rheumatic pains.

Doctor visits to include: vitamin B-12 injections, measurements, weight and diet counseling and management. Patients can typically expect to lose approximately 15 to 20 pounds during the first month. Our program supports healthy weight loss and does not utilize any synthetic substances, appetite suppressants, or stimulants.

Once you have lost your weight, the program provides a specific maintenance plan which has enabled hundreds of patients to keep the weight off permanently.
